

TECHNICAL DATA SHEET

VARIABLE ORIFICE BALANCING VALVE

cim 3739B / G

PN 16

Main features:

Cim 3739B and 3739G are used for balancing the flow in cooling, heating and domestic water systems.

They are a combined manual presetting valve with following features:

- Variable measurement orifice;
- Supplied with 2 pcs. of measuring nipples for needles;
- Handwheel with shut-off function and clear 360° reading;
- Digital scale with lock function;
- High measuring accuracy.

It is supplied with flanged ends (Cim 3739B) or grooved end (Cim 3739G).

It is made of EN-JL 1040 cast iron.

These articles are made in compliance with the quality management requirements of ISO 9001:2008 standard.

All articles are tested according to EN 12266-1:2003 standard.

They can be used in a wide variety of sectors: heating, air conditioning, water, sanitary systems and generally with any non corrosive liquid.

Technical data:

Max. static working pressure	16 bar
Max. flow temperature	120 °C
Min. temperature	-10°C
Fluids:	Water and Glycol
Material of parts in contact with water:	Valve body; Spindle; Cone, etc.
Materials:	Cast Iron (EN-JL 1040)
O-rings:	EPDM
Flanges:	ISO 7005-2 (PN 16)
Face to face dimension standard:	EN 558, S 1

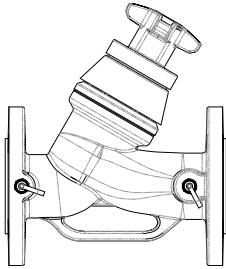

Approved by*:

*Cim 3739B

Installation procedure:

Remove the protecting covers of the flanges if applicable. Before installation of CIM 3739B, check that inside the valve and the pipes, there are no foreign matters which might damage the tightness of the valve.

When installing the valve, please make sure to have a pipe length 5 times the DN upstream the valve and 2 times the DN downstream, and pay attention to the arrow direction casted on the valve body, which shall be the same as the flow one.

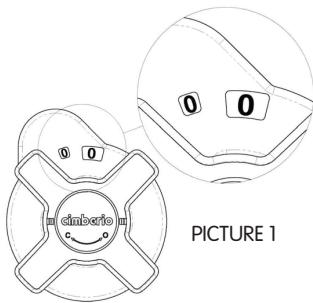

The valve can be installed with handle in any position. If fluid is not sure to be cleaned, it is advisable to have the handle upwards.

CIM 3739B shall be installed to the flanges of the pipe perfectly aligned with its flanges, by assuring that coupled parts will not suffer any stress. The valve shall not be used as anchor for hanging pipes, rather it is the pipe that shall support the valve itself. Make sure to true up the tightening gaskets of the flanges before tightening the bolts.

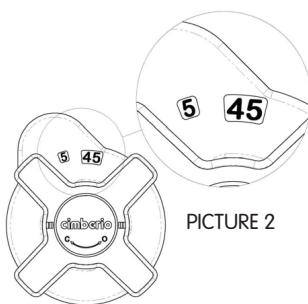

Pay attention to any welding procedure carried out in the installation, for this could cause high temperatures exceeding the working limits of the valve. Pipes should be equipped with thermal expansion joint.

TECHNICAL DATA SHEET

Regulating:

PICTURE 1

PICTURE 2

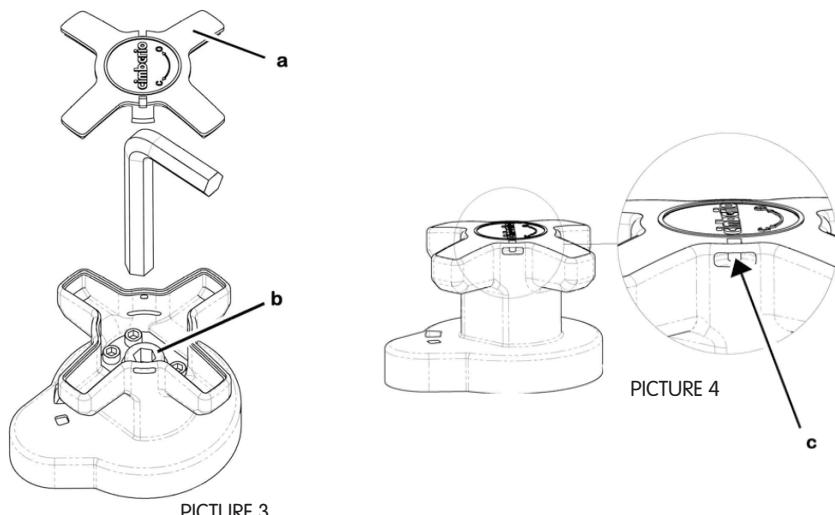

To close the valve, rotate clockwise the handle until the stop. The position of the obturator is given by the numbers shown in the two windows of the handle. The left window shows the complete turns, while the right one shows the hundredths of turn at interval of 0,05 (see picture 1). When the valve is completely closed, the two windows show a 0,0 value.

Δp and relevant flow rate values can be read through the differential manometer Cim 726. This interfaces with the balancing valve through two sensors inserted in the binder points placed at the two ends of the valve, near the flanges. Looking at the data showed in the herewith attached diagrams, it is possible to regulate the flow by rotating the handle anti-clockwise until the required flow rate is reached (f.i. 5, 45 picture 2).

When the regulating position is reached, take the cover "a" of the handle off (picture 4) by a screwdriver.

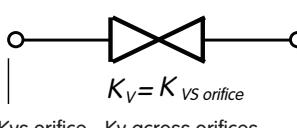

Rotate clockwise the screw "b" (picture 3) placed under the cover by an Allen Key 8 mm. until the stop. In this way, the valve can be closed and opened again up to the regulating value fixed previously.

In order to prevent the removal of the cover after the balancing process, lock the cover by a metallic wire inserted in the proper hole "c" (picture 4) and then seal it. In this way the regulating screw of the total opening is no more accessible.

PICTURE 4

Sizing:

FLOW COEFFICIENT

K_v , in metric system represents the flow in m^3/h of water at the temperature of 15.5°C (density = 998 kg/m^3) which causes a pressure drop of 1 bar. In the USA flow coefficient is called C_v ($K_v = 0.865 C_v$).

$$K_v = \frac{Q}{\sqrt{\Delta p}}$$

It is possible to calculate the pressure drop across a valve with a generic flow rate and fluid:

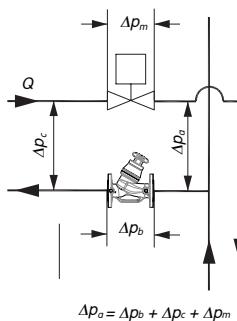

$$\Delta p = r \cdot \left(\frac{Q}{K_v} \right)^2$$

where:

r is the relative density, Q is the flow rate in m^3/h .

Relative density	
Fluid	r
Water	1.000
Water and glycol 10%	1.012
Water and glycol 20%	1.028
Water and glycol 30%	1.040
Water and glycol 40%	1.054
Water and glycol 50%	1.067

TECHNICAL DATA SHEET

SUGGESTED VALUES AND TIPS:

- Pressure drop across the valve:
Max = 50 kPa
- Pressure drop across the binders:
Max = 50 kPa
Min = 1 kPa
- Velocities in the pipeline:
Max = 3 m/s
Min = 0.75 m/s

For the preliminary sizings where the value of pressure drop across the valve is not known, use a value of 10 kPa.

EXAMPLE

It is required to balance the circuit in the figure, the given data are:

- Necessary pressure for the circuit: $\Delta p_c = 13$ kPa;
- Available pressure for the riser: $\Delta p_a = 35$ kPa;
- Pressure drop across the control valve: $\Delta p_m = 10$ kPa;
- Flow rate: $Q = 30 \text{ m}^3/\text{h} = 8.33 \text{ l/s}$.

The required differential pressure across the balancing valve can be calculated using the following relation:

$$\Delta p_b = \Delta p_a - \Delta p_m - \Delta p_c = 35 - 10 - 13 = 12 \text{ kPa} = 0.12 \text{ bar}$$

the required Kv is:

$$Kv = Q \cdot \sqrt{\frac{r}{\Delta p_b}} = 30 \cdot \sqrt{\frac{1}{1.2}} = 86.6$$

Using the attached tables to this datasheet, it is possible to find the following available valves with the relative position of the handle:

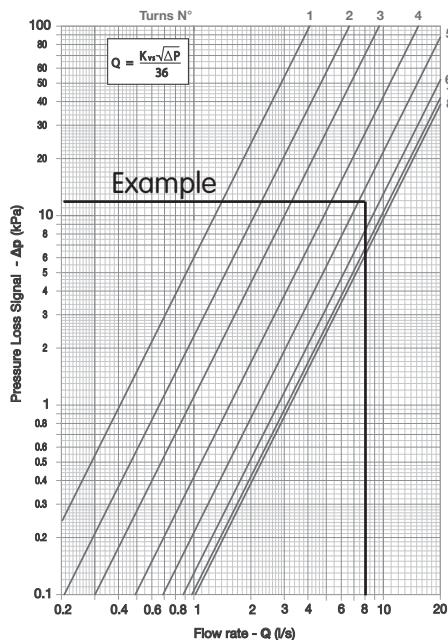

- Cim 3739B DN 80 --> Preset: 5.4 (Kv=86.40);
- Cim 3739B DN 100 --> Preset: 4.1 (Kv=85.06);
- Cim 3739B DN 125 --> Preset: 1.3 (Kv=85.93);
- Cim 3739B DN 150 --> Preset: 2.8 (Kv=88.38);

The four selected models are comparable. As a general rule, it is better to choose the valve with the smallest diameter, in this way the valve will be quite opened and there will be no problem with noises and cavitations.

Measuring the pressure drop across the binders of the Cim 3739B DN 80 (Preset 5.4), the operator will find this value:

$$\Delta p_{bin} = r \left(\frac{Q}{Kvs} \right)^2 = 1 \cdot \left(\frac{30}{86.4} \right)^2 = 0.12 \text{ bar} = 12 \text{ kPa}$$

N.B. The Kvs value is equal to the Kv of the valve and the measured pressure drop across the binders is the pressure drop across the valve too.

TECHNICAL DATA SHEET

Maintenance:

As a rule, the balancing valve does not need any maintenance. In case of replacement or need of disassembling of some components of the valve, make sure that the installation is not under service or pressure.
